

TRADITIONAL MUDJACKING

Don't replace it, raise it! [®]

WHAT IS MUDJACKING?

We drill 2" holes through a slab of concrete and insert a grout combination. When all voided areas are filled, the injection mix raises the slab to the desired height. The area is then broom cleaned and core holes are repaired to produce a smooth, level surface. This procedure can be completed in a matter of hours with minimal disruption to normal traffic areas.

BEFORE The concrete is unsightly & a dangerous trip hazard.

AFTER This driveway is now safe & level again!

PROCESS

Helitech® has established a method to raise sinking concrete at a third the cost of replacement. Instead of breaking up, removing, and repouring the entire concrete slab, Helitech® uses a hydraulic pressure system to insert a grout combination below the surface. The grout injection, consisting of Portland cement, aggregate, and water, fills the voided areas and raises your sunken concrete back to a level surface.

DON'T REPLACE IT, RAISE IT!®

Residential: Sidewalks, Porches, Garage floors, Basement floors, and Swimming pool aprons.

Commercial & Industrial applications: Concrete streets, Factory floors, and Bridge approaches.
